for anyone that needs property data for compounds casrn numbers for computer or other searches a consistent tabulation of molecular weights to synthesize inorganic materials on a laboratory scale or information on commercial and other uses for various compounds this volume is the perfect reference this second edition is fully revised and updated new data include optical inorganics radiation detection inorganics thermochromic compounds piezochromic compounds metal ion coordination complexes expanded crystallographic and structural data for inorganics catalysts superconductors and luminescent fluorescent and phosphorescent inorganics

writing chemical reactions in general and inorganic chemistry is not a trivial task however writing reactions for chemical processes correctly is a clear indicator of proficiency and competence in a subject unfortunately very few students grasp the concept of the correct writing of chemical reactions quickly and so are unable to move through topics of general analytical and inorganic chemistry freely because the ability to write and balance different types of chemical reactions is a fundamental issue this becomes a key question of chemical literacy the successful writing of chemical reactions includes two components the prediction of products of these reactions and their possible variations and balancing these reactions providing a material balance between starting compounds and reactions products this book explores that element of the teaching of the fundamentals of chemical literacy writing complete equations of chemical reactions and balancing them it contains 49 figures 22 schemes and 12 tables and 93 problems with answers this book will be very useful for high school students interested in chemical sciences higher education teachers students in colleges and universities majoring in chemistry and biochemistry and chemistry professional working in industry it also contains information about properties of the most common elements and applications of a variety of their chemical compounds

heterogeneous catalysis is deeply founded on solid state chemistry but the relationship between the two often appears to be elusive in many cases it is generally difficult to relate the allusion of symmetry to the crystal structure and the defect chemistry or acid base properties to the surface reconstruction and extended defects that in most cases are the basis of physicochemical properties and solids applications this book provides insights into solid state chemistry in order to widen the vision of heterogeneous catalysis it covers a broad range of solid state related topics including symmetry and structure organization bonding and methods for structure elucidation as well as defects formation and their implications in heterogeneous catalysis

this reference describes standard and nonstandard coordination modes of ligands in complexes the intricacies of polyhedron programmed and regioselective synthesis and the controlled creation of coordination compounds such as molecular and h n p complexes chelates and homo and hetero nuclear compounds it offers a clear and concise review of modern synthetic techniques of metal complexes as well as lesser known gas and solid phase synthesis electrosynthesis and microwave and ultrasonic treatment of the reaction system the authors pay special attention to o hydroxyazomethines and their s se containing analogues b

diketones and quinines among others and examine the immediate interaction of ligands and metal salts or carbonyls
